

## **Gen-i-Sys**

### Introduction

Gen-i-Sys is a three-part Internet application development system.

#### **Gen-i-Sys Designer**

A Windows application used to define applications. Through this module, analysts will design tables, workflows, request forms, approval processes, routing processes, and automated and manual work. No direct interaction with the database is necessary.

#### **Gen-i-Sys Internet**

An internet/intranet application that most users will see. Completely browser based with zero deployment, users will interact with their applications through this system. **Gen-i-Sys Internet** is used for performing data entry, initiating and tracking workflows, running reports and performing general maintenance.

#### **Gen-i-Sys Exchange**

An import/export module that handles all data coming in to and going out of the main Gen-i-Sys databases. This module allows automated polling for new data, scheduled interfaces and all other data transfer services necessary for workflows involving other systems.

SynCo Technologies, Inc. has working prototypes for the **Gen-i-Sys Designer**, **Gen-i-Sys Internet** and **Gen-i-Sys Exchange** modules. Contact SynCo Technologies for a demonstration.
